

WHAT THIS IS

A 2-page Power BI dashboard measuring delivery SLA compliance for a LATAM logistics company. 4 countries, 5 carriers, full year 2025. Think of 'SLA breach' = a package that arrived late.

WHAT I NEED FROM YOU

Feedback on clarity, narrative, and visual choices not on the logistics content. Does the story land? Do the visuals earn their space? Is anything confusing?

ONE NUMBER TO ANCHOR ON

SLA Breach Rate = % of late deliveries. Target: <10%. Actual: 18.0%. Everything in the dashboard either explains why, or shows what it costs.

PAGE 1 Executive Overview

FIRST LOOK

Before reading any number what's the immediate mood of this page?
Does the color palette signal 'there is a problem here' without needing to read anything?

Notes:

KPI CARDS

The 6 top cards, do you read them left to right as a logical sequence?
Intended flow: what's the rate → the flip side → how many total → how many late → how bad → what it costs.

Notes:

TREND LINE

There's a dashed yellow reference line at 10% on the chart. Does that context help, or is it too subtle / too obvious?
Also: does the shaded red area add meaning, or is it visual noise?

Notes:

BOTTOM ROW

The bottom has a regional bar chart and a cost breakdown panel. Do both feel necessary on Page 1, or does one belong on Page 2?
If you had to cut one from this page, which one?

Notes:

PAGE 2 Operational Deep Dive

PAGE SWITCH

Switching from Page 1 to Page 2, does it feel like a natural 'zoom in', or like a different report?

Is the visual language consistent enough to feel like the same product?

Notes:

HEATMAP

The heatmap shows each carrier × country as a color-coded cell. Can you spot the worst combination in under 5 seconds?

Does the color scale feel intuitive, or does it need the legend first?

Notes:

KEY FINDING

Below the heatmap there's a highlighted callout box with an analytical conclusion. Does it feel earned by the data, or does it feel like it's telling you what to think?

This is the most opinionated design choice in the report, honest reaction please.

Notes:

RECOMMENDATIONS

There are 5 recommendation cards at the bottom. Does that feel appropriate for a BI dashboard, or does it cross a line into 'too prescriptive'?

Would you expect recommendations on a dashboard, or only in a separate document?

Notes:

OVERALL Does the report tell a clear story problem on Page 1, diagnosis on Page 2? one thing, what would it be?

Who do you think this was built for exec, ops manager, or analyst?

If you could change
